FOR IMMEDIATE RELEASE

A Free Lecture....All About Asteroids

Phx.: The Phoenix Astronomical Society is once again with its monthly lecture series offering a free lecture Thursday, February 5, 2026, at 7:00 p.m. at the Paradise Valley Community College, Building Q120A 17811 North 32nd St., Phx.

Since the first asteroid was discovered in 1801, astronomers have used widely differing approaches to learn about their nature. Nearly all asteroids are point sources that show no details through the largest telescopes, so clever methods to determine their properties have evolved. These include photometry, radar imaging, and stellar occultations. Join our speaker Tom Polakis as his presentation about asteroids will range from historical discoveries to modern science.

We request that you register for this free event should changes be required:
